December 1997

## TABLE OF CONTENTS

### 1.0 METRIC CONVERSION

1.1 Overview	1
1.2 Items Changed By 1995 Coding Guide	1
1.3 Special Conversion Rules for Item 66	3
1.4 Computed Items	3

### 2.0 Using the PC Version of the Conversion Program

2.1 Installing the Conversion Program on the PC	5
2.2 Files Used by the Conversion Program	5

Appendix A - Job Flow

Appendix B - Sample Listing of JCL

Appendix C - Sample Report Output

## 1.0 METRIC CONVERSION

### 1.1 Overview

This document is to be used to run the a special metric conversion program for states that still have not converted their systems to metric. This conversion program (LE21M08A) uses a 416-character record comprised of the following:

- (1) The first 400 characters come from the 1988 Coding Guide record layout.
- (2) The last 16 characters are the five items that were added to the 1995 (metric) Coding Guide. These are items 12, 13, 63, 65, and 105.

The first version of the conversion program (LE21M05A) would convert a 400-character file into the new 432 character file, and initialize the five new items to spaces while doing so.

This version of the conversion program converts all the items the same way, and carries over the five new items. This way, states that are coding the new items, but have not yet fully converted to metric, will not have the new items blanked out each time.

One additional change in this new conversion program is that item 11 (Milepoint in English, Kilopoint in metric), is converted from miles to kilometers. The previous version of the conversion initialized item 11 to spaces.

This package contains the conversion program COBOL source code along with the Job Control Language (JCL) statements needed to run the program. A sample JCL stream is included in the enclosed mini-tape or floppy and in Appendix A.

### 1.2 Items Changed By 1995 Coding Guide

The majority of items changed by the 1995 Coding Guide were units of measure. These items were converted from English units to metric. In addition to these changes, five new items were added, two were deleted, and the coding for some existing items changed.

#### Unit of Measure Items

These items were converted to metric using the following conversion factors:

multiply feet (FT) by .3048 for meters (M)  
multiply miles (MI) by 1.609 for kilometers (K)  
multiply tons (TONS) by .9 for metric tons (MTONS)

Any of these items that had a value of all 9's before will still have a value of all 9's in the new metric record. The one exception to this rule is item 19, which will be converted from 99 to 199.

	Item 10 -	from	XX FT XX IN	to	XX.XX M
	Item 11 -	from	XXX.XXX MI	to	XXXX.XXX K
	Item 19 -	from	XX MI	to	XXX K
	Item 32 -	from	XXX FT	to	XXX.X M
*	Item 39 -	from	XXX FT	to	XXX.X M
*	Item 40 -	from	XXXX FT	to	XXXX.X M
*	Item 47 -	from	XX.X FT	to	XX.X M
	Item 48 -	from	XXXX FT	to	XXXX.X M
	Item 49 -	from	XXXXXX FT	to	XXXXXX.X M
	Item 50A	-	from XX.X FT	to	XX.X M
	Item 50B	-	from XX.X FT	to	XX.X M
	Item 51 -	from	XXX.X FT	to	XXX.X M
	Item 52 -	from	XXX.X FT	to	XXX.X M
	Item 53 -	from	XX FT XX IN	to	XX.XX M
	Item 54B	-	from XX FT XX IN	to	XX.XX M
	Item 55B	-	from XX.X FT	to	XX.X M
	Item 56 -	from	XX.X FT	to	XX.X M
	Item 64 -	from	XX TONS	to	XX.X MTONS
	Item 66 -	from	XX TONS	to	XX.X MTONS
	Item 76 -	from	XXXXXX FT	to	XXXXXX.X M
*	Item 116	-	from XXX FT	to	XXX.X M

\* **These vertical clearances were rounded down. All other items were rounded using standard rounding procedures.**

#### Items Deleted

Item 64A      Item 66A

### 1.3 Special Conversion Rules for Item 66 (Inventory Rating)

Before the Inventory Rating (OLD-ITEM-66B) can be converted from English tons to metric tons, the rating must first be adjusted to account for the Type of Loading (OLD-ITEM-66A). This is done using the same multipliers listed in the English Coding Guide on page 44 under the explanation for Structural Evaluation. The rules for calculating the metric Inventory Rating (NEW-ITEM-66) are shown below:

If the OLD-ITEM-66A equals 1 (H Loading);

$$\text{the NEW-ITEM-66} = (\text{OLD-ITEM-66B} * 1.25) * .9$$

If the OLD-ITEM-66A equals 3 (Alternate Interstate Loading);

$$\text{the NEW-ITEM-66} = (\text{OLD-ITEM-66B} * 1.20) * .9$$

If the OLD-ITEM-66A equals 5 (Type 3-S2 Unit);

$$\text{the NEW-ITEM-66} = (\text{OLD-ITEM-66B} * .70) * .9$$

If the OLD-ITEM-66A equals 6 (Type 3-3 Unit);

$$\text{the NEW-ITEM-66} = (\text{OLD-ITEM-66B} * .64) * .9$$

If the OLD-ITEM-66A equals any other value not listed above;

$$\text{the NEW-ITEM-66} = \text{OLD-ITEM-66B} * .9$$

### 1.4 Computed Items

Items 67, 68, 69, Deduct, Status, and Sufficiency Rating were not recomputed by the conversion program. The Edit/Update program will recompute these items.

## 2.0 USING THE PC VERSION OF THE CONVERSION PROGRAM

The Edit/Update conversion can be run on the PC. When this is done, a master file residing on your PC or network is used as input. The output file would then be fed into the PC version of the Edit/Update program (see manual "Edit/Update Program").

### 2.1 Installing the Conversion Program on the PC

The PC version of the conversion program and the PC version of the Edit/Update program are to be installed simultaneously. See the "Edit/Update Program" manual.

The input file for the conversion program will need to be created. This will be your 416-character English file. The file should be in your **C:\BRIDGE\** subdirectory with the name **CVINPUT.DAT**. This file should be sorted by State Code, Structure Number, then ITEM 5A.

### 2.2 Files Used by the Conversion Program

The following files on the high-density 3 1/2" floppy diskette are used for the conversion:

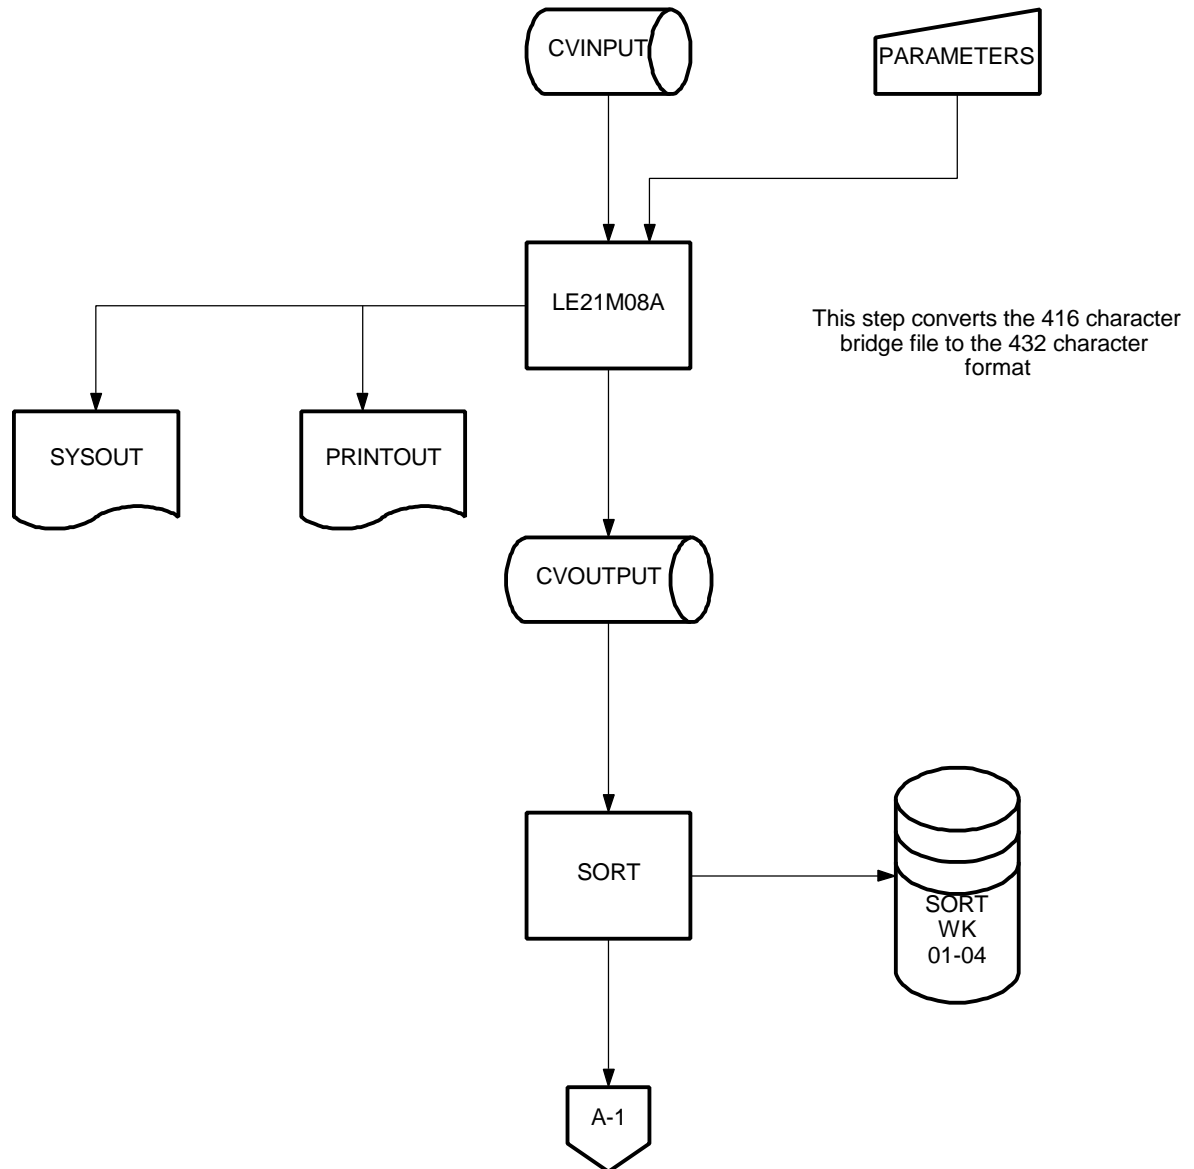

- (1) LE21M08A.EXE - The conversion program. Just type **CONV416** to execute.
- (2) CONV416.BAT - The batch file for running the conversion program.

The following file is output from the conversion program.

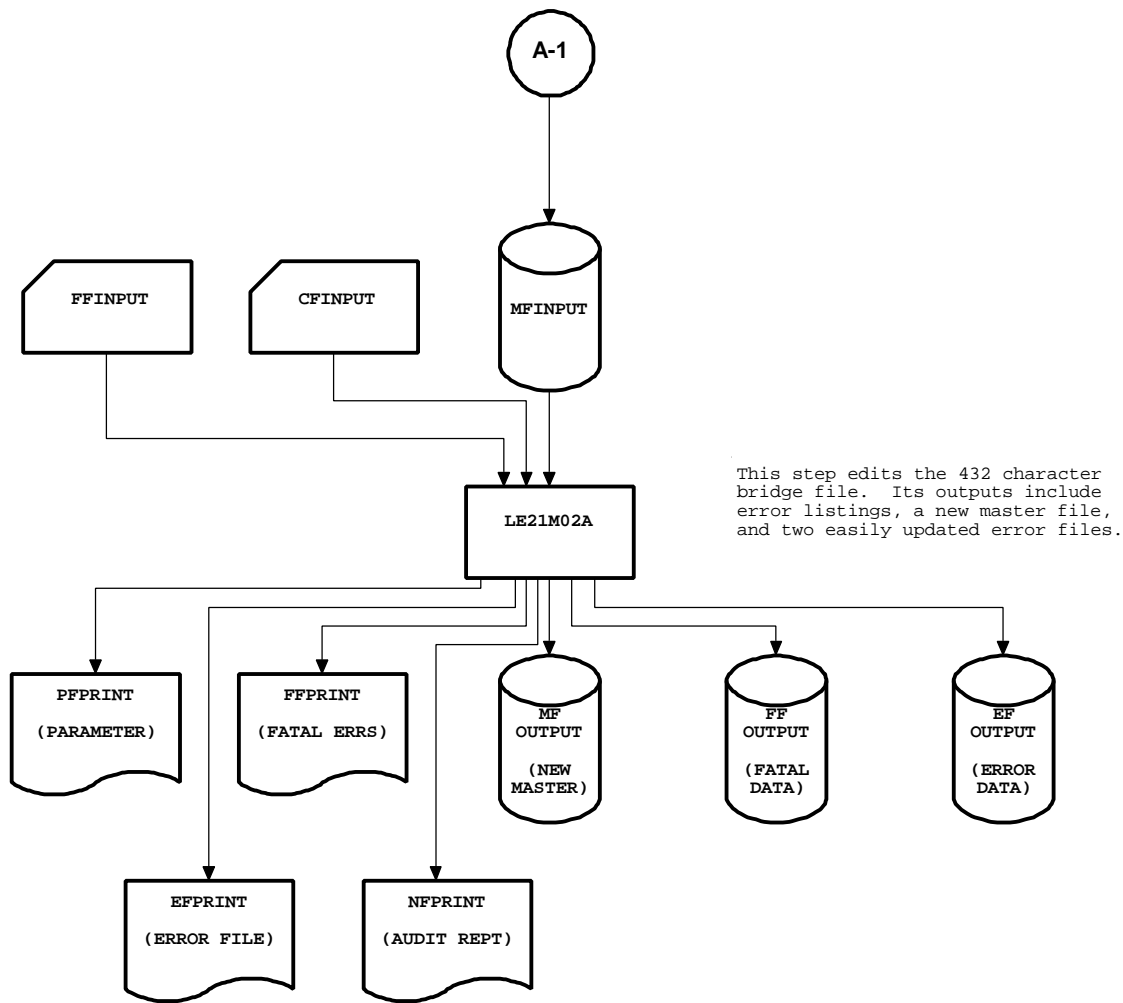

- (1) MFINPUT.DAT - The output master file. This file would be input to the Edit/Update program.

## APPENDIX A

# LE21JOBA

## APPENDIX B

The following is the JCL used to run the conversion, a sort, and the first run of the Edit/Update.

#### LE21JOBA

```

//

```

**where:**

**nnnnn** Enter a five-digit number with leading zeroes to specify how many records to print before and after images of (one record per page). EX: 00100 will print the first 100 records. 99999 will print all records.

**your.loadlib** Load library used where conversion programs are compiled and, optionally, any additional load libraries necessary for the site.

<b>english.master</b>	DSN of 416-character english master to be converted.
<b>metric.master</b>	DSN of 432-character bridge master after being converted.
<b>sorted.metric.master</b>	DSN of 432-character bridge master after being sorted.
<b>delimiter.item.char</b>	Tells program where the next ITEM information is.
<b>delimiter.data.end.char</b> <b>delimiter.data.start.char</b>	Tells program where actual value for an ITEM begins and ends. Start character can be the same or different. Recommendation is to use \ for both.
<b>delimiter.record.end</b>	Tells program where the next record begins.
<b>type.of.edit</b>	<p>Specify which type of edits to run. The four (4) types of runs are: ITEM (or I ) for individual item edits.</p> <p>CROSSCHECK (or C ) for crosscheck edits.</p> <p>REASONABLENESS (or R ) for only reasonableness edits.</p> <p>FINAL (or F ) to combine all types of edits. This option should be used before sending tape to Washington Headquarters Office.</p> <p><b>NOTE:</b> More than one TYPE OF EDIT card may be submitted for a run. For ITEM and CROSSCHECK edits can be performed and omitting REASONABLENESS edits. Code one type.of.edit per card.</p>
<b>lines.per.page.nbr</b>	Maximum number of printed lines per page for error listing reports.

<b>errors.per.report.nbr</b>	Maximum number of errors allowed on a run. If this number is exceeded, the edit program will stop running. To view all errors, code 99999.
<b>state.code</b>	Two (2) digit State code. Use 99 for multiple States.
<b>bypass.item.numbers</b>	Tells edit program which items <b>not</b> to edit. Specify by coding "I" followed by a blank, then the ITEM NUMBER. Code one ITEM per card.
<b>bridge.master</b>	New, 432-character master output from edit program.
<b>fatal.data.bridge.file</b>	Error file containing records with fatal errors, i.e., those involving ITEM 1, ITEM 8, or ITEM 5A.
<b>error.data.bridge.file</b>	Error file containing records with non-fatal errors.
